These problems help students understand how to apply multiplication and division in real-life situations. Examples include:

- A pack of gum costs \$2, and Lisa wants to buy 4 packs. How much will she spend?
- If there are 36 cookies and 9 friends want to share them equally, how many cookies will each friend get?

3. Fractions and Decimals Problems

Word problems involving fractions and decimals are crucial for understanding these concepts. Here are a couple of examples:

- If John ate $\frac{3}{4}$ of a pizza and there were 8 slices in total, how many slices did he eat?
- A pencil costs \$1.50. If Emily buys 3 pencils, how much does she spend in total?

4. Measurement and Data Problems

Measurement problems often require students to use their knowledge of units of measure, while data problems may involve interpreting graphs or charts. For instance:

- A garden is 10 feet long and 5 feet wide. What is the area of the garden?
- If a bar graph shows that 15 students like soccer, 10 like basketball, and 5 like baseball, how many students prefer soccer over basketball?
