Overview of the 99 Ford Expedition Air Suspension System

The 1999 Ford Expedition features an advanced air suspension system designed to improve ride quality and vehicle handling. Unlike traditional coil or leaf spring suspensions, air suspension uses inflatable air springs that adjust automatically to changing driving conditions. The system enhances passenger comfort by absorbing road impacts and maintaining consistent vehicle height regardless of load variations.

This air suspension system also plays a critical role in vehicle safety by promoting better traction and stability, especially when carrying heavy cargo or towing. The automatic leveling function ensures the Expedition remains level, preventing excessive body roll or nose dive during acceleration and braking. As a factory-installed feature on many 99 Ford Expedition models, the air suspension system represents a significant technological advancement for SUVs of that era.

Components of the Air Suspension System

The 99 Ford Expedition air suspension system consists of several key components working together to control ride height and comfort. Understanding these parts aids in effective diagnosis and repair.

Air Springs

Air springs replace traditional coil or leaf springs and are essentially rubber bladders filled with compressed air. These springs support the vehicle's weight while providing variable stiffness and damping based on air pressure levels.

Air Compressor

The air compressor is responsible for generating the pressurized air needed to inflate the air springs. It activates automatically to adjust pressure in response to sensor inputs.

Height Sensors

Height sensors monitor the distance between the vehicle body and the axle, sending real-time data to the control module. This information allows the system to maintain proper ride height by adjusting air pressure accordingly.

Control Module

The control module processes signals from the height sensors and controls the air compressor and solenoid valves to regulate air flow to each spring, ensuring proper vehicle leveling and comfort.

Air Lines and Valves

Air lines transport compressed air from the compressor to the air springs, while solenoid valves control the distribution and release of air to adjust suspension settings.

Common Problems and Troubleshooting

Despite its advantages, the 99 Ford Expedition air suspension system can encounter issues that affect performance and safety. Identifying common problems early can prevent costly repairs.

Air Leaks

One of the most frequent problems is air leaks in the air springs or air lines. Leaks cause the suspension to lose pressure, resulting in sagging or uneven ride height. Hissing sounds near the wheel wells often indicate leaks.

Compressor Failure

The air compressor may fail due to overuse or contamination, leading to inadequate air pressure. Symptoms include longer compressor run times, excessive heat, or complete suspension collapse.

Faulty Height Sensors

Malfunctioning height sensors can send incorrect signals, causing improper suspension adjustments. This may result in uneven vehicle stance or warning lights on the dashboard.

Electrical Issues

Wiring problems, blown fuses, or control module faults can disrupt system operation. Diagnosing electrical faults requires thorough inspection and testing of related components.

Maintenance and Repair Tips

Proper maintenance of the 99 Ford Expedition air suspension system extends its lifespan and ensures reliable performance. Regular inspections and timely repairs are crucial.

1. **Visual Inspection:** Routinely check air springs, lines, and compressor for signs of wear, cracks, or leaks.
2. **Listen for Unusual Noises:** Hissing or compressor noises can indicate air leaks or compressor strain.
3. **Check Sensor Alignment:** Ensure height sensors are clean and properly aligned for accurate readings.
4. **Monitor Warning Lights:** Address dashboard alerts promptly to avoid further damage.
5. **Keep Components Clean:** Dirt and debris can accelerate wear, so clean suspension parts regularly.
6. **Professional Diagnostics:** Use specialized diagnostic tools to identify electronic or sensor faults.

When repairing, replacing worn air springs or faulty compressors with OEM or high-quality aftermarket parts will maintain system integrity. Also, repairing leaks with proper sealants or component replacements is essential to prevent recurring issues.

Replacement and Upgrade Options

Owners of the 99 Ford Expedition air suspension system may consider replacement or upgrades to improve reliability and performance, especially as the vehicle ages.

OEM vs. Aftermarket Parts

Original Equipment Manufacturer (OEM) parts ensure compatibility and factory-level quality but may come at a higher cost. Aftermarket components provide cost-effective alternatives with varying levels of quality and warranty coverage.

Upgrading Air Springs

Modern air springs with improved materials and design offer enhanced durability and better resistance to environmental factors. Upgrading air springs can result in a smoother ride and longer service life.

Compressor Enhancements

Upgraded compressors with higher capacity and improved cooling features reduce failure rates and maintain consistent air pressure under demanding conditions.

Complete Suspension Kits

Some manufacturers offer complete air suspension upgrade kits designed to replace aging systems with modern technology, including advanced control modules and sensors.

Professional Installation

Due to the complexity of the air suspension system, professional installation and calibration are recommended for all replacements or upgrades to ensure safety and optimal functionality.

Frequently Asked Questions

What are common issues with the air suspension on a 1999 Ford Expedition?

Common issues with the air suspension on a 1999 Ford Expedition include air leaks in the bags or lines, a faulty air compressor, worn-out air springs, and problems with the suspension control module. These issues can cause the vehicle to sag, ride unevenly, or produce unusual noises.

How do I check if the air suspension system is failing on my 1999 Ford Expedition?

To check if the air suspension system is failing, look for signs such as uneven ride height, a rough or bouncy ride, warning lights on the dashboard, or the compressor running excessively. Inspect the air bags for visible cracks or leaks and listen for hissing sounds indicating air leaks.

Can I replace the air suspension on a 1999 Ford Expedition with traditional coil springs?

Yes, it is possible to replace the air suspension on a 1999 Ford Expedition with traditional coil springs. Many owners opt for a coil spring conversion kit to avoid the complexity and maintenance of air suspension. However, this may affect ride quality and vehicle height, so professional installation and alignment are recommended.

How much does it typically cost to repair the air suspension system on a 1999 Ford Expedition?

Repair costs for the air suspension system on a 1999 Ford Expedition can vary widely depending on the issue. Replacing air bags can cost between \$400 to \$700 per bag, compressors around \$300 to \$600, and labor can add several hundred dollars. Overall, a full repair or replacement might range from \$1000 to \$2500.

Is it safe to drive a 1999 Ford Expedition with a malfunctioning air suspension?

Driving a 1999 Ford Expedition with a malfunctioning air suspension is not recommended.
