- Nucleus: The control center of the cell, containing genetic material (DNA).
- Ribosomes: The sites of protein synthesis.
- Mitochondria: The powerhouse of the cell, producing ATP (energy) through cellular respiration.
- Endoplasmic Reticulum (ER):
 - Rough ER: Studded with ribosomes; involved in protein synthesis and processing.
 - Smooth ER: Lacks ribosomes; involved in lipid synthesis and detoxification.
- Golgi Apparatus: Responsible for modifying, sorting, and packaging proteins for secretion or delivery to other organelles.
- Lysosomes: Contain digestive enzymes to break down waste materials and cellular debris.
- Chloroplasts: Found in plant cells; responsible for photosynthesis.
- Cell Membrane: A lipid bilayer that controls the movement of substances in and out of the cell.

3. Cell Functions and Processes

Understanding how organelles contribute to cell functions is essential. The worksheet may include sections on:

- Cellular Respiration: The process by which cells convert glucose and oxygen into energy (ATP).
- Photosynthesis: The process by which plants convert sunlight into chemical energy.
- Cell Division: The mechanisms by which cells replicate, including mitosis and meiosis.

4. Diagrams and Labeling Exercises

Visual aids are often included in the worksheet, requiring students to label parts of a cell. This section reinforces learning through visual recognition. Common diagrams may include:

- Plant cell vs. animal cell comparisons.
- Detailed diagrams of specific organelles.
