- Prerequisites: Real analysis or advanced calculus
- Focus Areas:
 - Complex functions and their properties
 - Contour integration and residue theorem
 - Applications in physics and engineering

4.2 Probability and Statistics

This course introduces students to the world of data analysis, probability theory, and statistical inference. Although it may seem less rigorous than pure math courses, it requires a solid understanding of calculus.

- Prerequisites: Calculus II
- Focus Areas:
 - Probability theory and distributions
 - Hypothesis testing and confidence intervals
 - Regression analysis and statistical modeling

4.3 Numerical Analysis

Numerical analysis focuses on algorithms for approximating solutions to mathematical problems, playing a significant role in computer science and engineering.

- Prerequisites: Calculus III and linear algebra
