Understanding the overall design and purpose of these locks is crucial before delving into the specifics of the parts manual.

Design and Functionality

The Corbin Russwin mortise lock utilizes a heavy-duty mechanism housed within a lock body that fits into a mortise pocket cut into the door edge. This design supports features such as key operation from both sides, latch retraction via lever handles, and deadbolt engagement for added security. The lock's internal components are engineered for smooth operation and long-lasting durability, especially in high-traffic environments. The parts manual details these elements to assist in

identifying each part's role within the lock assembly.

Applications and Security Benefits

These mortise locks are commonly installed in office buildings, schools, hospitals, and government facilities due to their reliability and compliance with safety standards. Their robust construction helps resist forced entry and tampering attempts. The Corbin Russwin mortise lock parts manual outlines all elements that contribute to this security, such as reinforced strike plates, hardened bolts, and precision tumblers, ensuring users can maintain optimal security levels.

Key Components in the Corbin Russwin Mortise Lock Parts Manual

The Corbin Russwin mortise lock parts manual provides a comprehensive breakdown of all components necessary for the lock's operation. Familiarity with these parts allows for accurate identification, repair, and replacement, which is vital for maintaining lock integrity and function.

Lock Body and Case

The lock body serves as the main housing for all internal mechanisms. It is typically constructed from steel or brass to provide strength and resistance to wear. The manual details the dimensions and specifications for the lock case, which is essential for compatibility with different door types and thicknesses.

Latches and Deadbolts

The latch is the spring-loaded bolt that retracts to allow door opening and extends to secure the door when closed. The deadbolt provides an additional layer of security by extending deeper into the door frame when locked. The manual specifies various latch and deadbolt types, including their lengths, throw distances, and material composition.

Lock Cylinder and Key Mechanism

The cylinder is the part of the lock that accepts the key and initiates the locking or unlocking process. Corbin Russwin offers a range of cylinders compatible with their mortise locks, including interchangeable core options. The parts manual includes diagrams and part numbers for these cylinders, assisting in selection and replacement.

Levers, Handles, and Trim

The manual outlines dimensions and installation requirements for these parts, critical for ensuring secure engagement and aesthetic consistency.
